# OGI launches Diamscope® Nano

## Makes polished stone sorting easier, quicker and more accurate

By: Diamond World News Service

OGI Systems LTD has introduced Diamscope® Nano, as a solution for the polished diamond industry to eliminate the elaborate manual sorting of diamonds. This innovation is a small-stone sorting computerized gauge applied to achieve invisible settings during the embedment of the stones.

Diamscope® Nano offers a simplistic solution to small-stone quick sorting. It has been designed in a compact and user-friendly manner, to deliver most accurate results and proved especially beneficial for bulk quantities of small stones – diamonds or other gemstones – that need quick and accurate sorting. It measures any stone shape, including princess, baguette and especially square shapes, displaying corner angles, length, width and edge.

The Diamscope® Nano is a USB Plug N' Play based system which is hands-on and does not require any special skills to operate. The diamond only needs to be placed on the platform, and the results will be generated in a split-second.
