OGISYSTEMS INTRODUCES NEW DIAMOND-SYMMETRY GRADING TECHNOLOGY

28 March 2012

Israel-based OGI Systems Ltd, a global company that offers technological solutions to the diamond industry, recently began assimilation of a unique technological solution for automatic symmetry grading of Round Brilliant diamonds in several majors labs around the world.

According to OGI Systems, up until now, grading of symmetry in polished diamonds was done visually by a gemologist using a microscope, which required of the gemologist a great deal of mastery and time.

Following extensive research and development, OGI Systems successfully developed a Scanox HD grading system that includes unique symmetry software that has the ability to quantify and grade automatically the vast majority of parameters constituting the symmetry of a diamond.

The company notes that this system is now available for all labs, manufacturers and dealers of diamonds around the world.
